**A-DG Dual Fuel Burner**  
**NG and LPG are switched directly**

**Product Description**

When the A-DG burner is switched directly between NG and LPG, there is no significant change in operation safety, efficiency, performance and nitride emission. In the actual production, users can choose more favorable fuels from the aspects of gas source stability, fuel quality and fuel price according to the actual conditions; when the conditions change, they can directly switch fuels without too many changes to the control system.
